Kernels Part II: Reproducing Kernel Hilbert Spaces (RKHS)

Lorenzo Rosasco

MaLGa- Machine learning Genova Center Universitá di Genova MIT IIT

Linear models →features →kernels

$$\boldsymbol{x}^{\top}\boldsymbol{x}' \quad \mapsto \quad \boldsymbol{\Phi}(\boldsymbol{x})^{\top}\boldsymbol{\Phi}(\boldsymbol{x}') \quad \mapsto \quad \boldsymbol{k}(\boldsymbol{x},\boldsymbol{x}')$$

"The kernel trick"

Outline

PD kernels

RKH

A bit more than a trick...

► Feature maps

▶ PD kernels

► RKHS

Can we start from a kernel?

Can we start from a kernel?

What is a kernel?

 $k(\boldsymbol{x},\boldsymbol{x}')$

Can we start from a kernel?

What is a kernel?

 $k(\boldsymbol{x},\boldsymbol{x}')$

Two words:

Positive definite

 $k: X \times X \to \mathbb{R}$ is positive definite if:

1. for all $x_1, \ldots, x_N \in X$, the $N \times N$ matrix \widehat{K} with entries

$$\widehat{K}_{ij} = k(\textbf{x}_i,\textbf{x}_j)$$

is positive semidefinite (non negative eigenvalues)

$k: X \times X \to \mathbb{R}$ is positive definite if:

1. for all $x_1, \ldots, x_N \in X$, the $N \times N$ matrix \widehat{K} with entries

$$\widehat{K}_{ij} = k(\boldsymbol{x}_i, \boldsymbol{x}_j)$$

is positive semidefinite (non negative eigenvalues)

2. Equivalently for all $x_1, \dots, x_N \in X$, and $a \in \mathbb{R}^N$

$$\mathbf{a}^{\top}\widehat{\mathbf{K}}\mathbf{a}\geqslant\mathbf{0},\qquad \forall \mathbf{a}\in\mathbb{R}^{\mathbf{N}}.$$

$k: X \times X \to \mathbb{R}$ is positive definite if:

1. for all $x_1, \ldots, x_N \in X$, the $N \times N$ matrix \widehat{K} with entries

$$\widehat{K}_{ij} = k(\textbf{x}_i,\textbf{x}_j)$$

is positive semidefinite (non negative eigenvalues)

2. Equivalently for all $x_1, \ldots, x_N \in X$, and $a \in \mathbb{R}^N$

$$a^{\top}\widehat{K}a\geqslant 0, \qquad \forall a\in \mathbb{R}^{N}.$$

3. Equivalently, for all $a_1,\dots,a_N\in\mathbb{R}$, $x_1,\dots,x_N\in X$,

$$\sum_{i,i=1}^N k(x_i,x_j) a_i a_j \geqslant 0.$$

 $k: X \times X \to \mathbb{R}$ is positive definite if:

1. for all $x_1, \ldots, x_N \in X$, the $N \times N$ matrix \widehat{K} with entries

$$\widehat{K}_{ij} = k(\textbf{x}_i,\textbf{x}_j)$$

is positive semidefinite (non negative eigenvalues)

2. Equivalently for all $x_1, \ldots, x_N \in X$, and $a \in \mathbb{R}^N$

$$\mathbf{a}^{\top}\widehat{\mathbf{K}}\mathbf{a}\geqslant\mathbf{0}, \qquad \forall \mathbf{a}\in\mathbb{R}^{N}.$$

3. Equivalently, for all $a_1, \ldots, a_N \in \mathbb{R}$, $x_1, \ldots, x_N \in X$,

$$\sum_{i,i=1}^N k(x_i,x_j) a_i a_j \geqslant 0.$$

Symmetry is also always assumed.

Inner product kernels are PD

For
$$\Phi: X \to \mathbb{R}^p$$
, $p \leqslant \infty$ let

$$\mathbf{k}(\mathbf{x},\mathbf{x}') = \Phi(\mathbf{x})^{\top}\Phi(\mathbf{x}')$$

Inner product kernels are PD

For $\Phi: X \to \mathbb{R}^p$, $p \leqslant \infty$ let

$$\boldsymbol{k}(\boldsymbol{x},\boldsymbol{x}') = \boldsymbol{\Phi}(\boldsymbol{x})^{\top}\boldsymbol{\Phi}(\boldsymbol{x}')$$

▶ Then

$$\sum_{i,j=1}^N k(x_i,x_j) a_i a_j = \sum_{i,j=1}^N \Phi(x_i)^\top \Phi(x_j) a_i a_j = \|\sum_{i=1}^N \Phi(x_i) a_i\|^2 \geqslant 0.$$

Inner product kernels are PD

For $\Phi: X \to \mathbb{R}^p$, $p \leqslant \infty$ let

$$\boldsymbol{k}(\boldsymbol{x},\boldsymbol{x}') = \boldsymbol{\Phi}(\boldsymbol{x})^{\top}\boldsymbol{\Phi}(\boldsymbol{x}')$$

▶ Then

$$\sum_{i,j=1}^N k(x_i,x_j) a_i a_j = \sum_{i,j=1}^N \Phi(x_i)^\top \Phi(x_j) a_i a_j = \|\sum_{i=1}^N \Phi(x_i) a_i\|^2 \geqslant 0.$$

► Clearly k is symmetric.

Kernel properties

Let $K_1: \mathbb{R}^d \times \mathbb{R}^d \to \mathbb{R}, K_2: \mathbb{R}^d \times \mathbb{R}^d \to \mathbb{R}, K_3: \mathbb{R}^t \times \mathbb{R}^t$ be kernels, $\mathbf{x}, \mathbf{x}' \in \mathbb{R}^d$, $\mathbf{z}, \mathbf{z}' \in \mathbb{R}^t$ and $\alpha, \beta > 0$ then the following are also kernels

- $1. \ \alpha K_1(\textbf{x},\textbf{x}') + \beta K_2(\textbf{x},\textbf{x}')$
- 2. $K_1(\mathbf{x}, \mathbf{x}')K_2(\mathbf{x}, \mathbf{x}')$

Kernel properties

Let $K_1: \mathbb{R}^d \times \mathbb{R}^d \to \mathbb{R}, K_2: \mathbb{R}^d \times \mathbb{R}^d \to \mathbb{R}, K_3: \mathbb{R}^t \times \mathbb{R}^t$ be kernels, $\mathbf{x}, \mathbf{x}' \in \mathbb{R}^d$, $\mathbf{z}, \mathbf{z}' \in \mathbb{R}^t$ and $\alpha, \beta > 0$ then the following are also kernels

- 1. $\alpha K_1(\mathbf{x}, \mathbf{x}') + \beta K_2(\mathbf{x}, \mathbf{x}')$
- $2. \ K_1(\boldsymbol{x},\boldsymbol{x}') K_2(\boldsymbol{x},\boldsymbol{x}')$
- 3. $p(K_1(x,x'))$ for any p a function whose polynomial expansion has only non-negative coefficients
- 4. $f(x)K_1(x,x')f(x')$ for any $f: \mathbb{R}^d \to \mathbb{R}$
- 5. $\frac{K_1(x,x')}{\sqrt{K_1(x,x)K_1(x',x')}}$
- 6. $K_3(\psi(x), \psi(x))$ for any $\psi : \mathbb{R}^d \to \mathbb{R}^t$
- 7. $\alpha K_1(\mathbf{x}, \mathbf{x}') + \beta K_3(\mathbf{z}, \mathbf{z}')$
- 8. $K_1(x, x')K_3(z, z')$

There are many PD kernels

All the examples seen so far are based on inner products.

- ► linear $\mathbf{k}(\mathbf{x}, \mathbf{x}') = \mathbf{x}^{\top} \mathbf{x}'$
- ▶ polynomial $k(\mathbf{x}, \mathbf{x}') = (\mathbf{x}^{\top}\mathbf{x}' + 1)^{s}$
- ► Gaussian $k(\mathbf{x}, \mathbf{x}') = e^{-\|\mathbf{x} \mathbf{x}'\|^2 \gamma}$

X need not be \mathbb{R}^d , one can consider

- ▶ kernels on probability distributions
- ▶ kernels on strings
- ▶ kernels on functions
- ▶ kernels on groups
- ▶ kernels graphs
- ▶ .

Convolution kernels

- ▶ Sets $X, X_1, ..., X_D$ and $X^D = X_1 \times X_2 \times ... X_D$.
- $\blacktriangleright \ \ \text{Pd kernels} \ k_1: X_1 \times X_1 \to \mathbb{R}, \ \dots \ k_D: X_D \times X_D \to \mathbb{R}$
- ▶ Relation $R: X^D \times X \rightarrow \{0,1\}$ and

$$R^{-1}(x) = \{x^D \in X^D \mid R(x^D, x) = 1\}$$

Interpretation

- $ightharpoonup x^D = (x_1, \dots, x_D) \in X^D$ are the possible parts of x.
- $ightharpoonup R(x^D, x) = 1 \text{ if } x^D \text{ are the parts of } x$

Example $X = X_1 = X_2$ strings over a finite alphabet.

$$R((\textbf{x}_1,\textbf{x}_2),\textbf{x})=1 \quad iff \quad \textbf{x}_1 \circ \textbf{x}_2=\textbf{x}.$$

Convolution kernels

- ▶ Sets $X, X_1, ..., X_D$ and $X^D = X_1 \times X_2 \times ... X_D$.
- $\blacktriangleright \ \ \text{Pd kernels} \ k_1: X_1 \times X_1 \to \mathbb{R}, \ \dots \ k_D: X_D \times X_D \to \mathbb{R}$
- ▶ Relation $R: X^D \times X \rightarrow \{0,1\}$ and

$$R^{-1}(x) = \{x^D \in X^D \mid R(x^D, x) = 1\}$$

Interpretation

- $ightharpoonup x^D = (x_1, \dots, x_D) \in X^D$ are the possible parts of x.
- $ightharpoonup R(x^D, x) = 1 \text{ if } x^D \text{ are the parts of } x$

Convolution kernel

$$k(x,z) = \sum_{x^D \in R^{-1}(x), z^D \in R^{-1}(z)} \prod_{j=1}^D k_j(x_j, z_j)$$

A bit more than a trick...

► Feature maps

▶ PD kernels

► RKHS

Outline

PD kernels

RKHS

Function spaces

$$\Phi \quad \mapsto \quad f(\boldsymbol{x}) = \boldsymbol{w}^\top \Phi(\boldsymbol{x})$$

$$k \quad \mapsto \quad f(x) = \ ?$$

Function spaces

$$\Phi \quad \mapsto \quad \mathfrak{H}_{\Phi} = \{f: X \to \mathbb{R} \mid \exists ! \ w \in \mathfrak{F} \ \text{s.t.} \ f(x) = w^{\top} \Phi(x), \ \forall x \in \mathfrak{X} \}$$

$$k \quad \mapsto \quad \mathfrak{H}_k = ?$$

Hilbert spaces

Hilbert space H

► Linear space (closed under sum/multiplication with reals)

$$h_1,h_2\in\mathcal{H}, \textbf{a},\textbf{b}\in\mathbb{R} \qquad \Rightarrow \qquad \textbf{a}h_1+\textbf{b}h_2\in \textbf{H}$$

Hilbert spaces

Hilbert space H

► Linear space (closed under sum/multiplication with reals)

$$h_1,h_2\in\mathcal{H}, \text{a}, \text{b}\in\mathbb{R}\qquad \Rightarrow \qquad \text{a}h_1+\text{b}h_2\in H$$

▶ With an inner product (positive and symmetric bilinear form)

$$\boldsymbol{h}_1^{\top}\boldsymbol{h}_2$$

Hilbert spaces

Hilbert space H

► Linear space (closed under sum/multiplication with reals)

$$h_1,h_2\in\mathcal{H}, a,b\in\mathbb{R}\qquad \Rightarrow\qquad ah_1+bh_2\in H$$

▶ With an inner product (positive and symmetric bilinear form)

$$\mathbf{h}_1^{\top}\mathbf{h}_2$$

► complete (Cauchy sequences converge)¹

$$(h_j)_j \quad i,j>N, \quad \|h_j-h_i\|\leqslant \varepsilon \qquad \Rightarrow \qquad \lim_{j\to\infty} h_j=h\in H$$

Function spaces

$$\Phi \quad \mapsto \quad \mathfrak{H}_{\Phi} = \{ f: X \to \mathbb{R} \mid \exists ! \ w \in \mathfrak{F} \ \text{s.t.} \ f(x) = w^{\top} \Phi(x), \ \forall x \in \mathfrak{X} \}$$

It's a Hilbert space since $\mathcal F$ is!

$$k \quad \mapsto \quad \mathfrak{H}_k = ?$$

From PD kernels to function spaces

For a set X and PD kernel k:

▶ define the linear the space of functions²

$$f(\boldsymbol{x}) = \sum_{i=1}^{N} k(\boldsymbol{x}, \boldsymbol{x}_i) a_i$$

for any $a_1, \ldots, a_N \in \mathbb{R}$, $x_1, \ldots, x_N \in X$ and any $N \in \mathbb{N}$.

From PD kernels to function spaces

For a set X and PD kernel k:

▶ define the linear the space of functions²

$$f(\textbf{x}) = \sum_{i=1}^{N} k(\textbf{x}, \textbf{x}_i) a_i$$

for any $a_1, \ldots, a_N \in \mathbb{R}$, $x_1, \ldots, x_N \in X$ and any $N \in \mathbb{N}$.

▶ define the inner product

$$\langle f,f'\rangle = \sum_{i=1}^N \sum_{j=1}^{N'} k(\textbf{x}_i,\textbf{x}_j') a_i a_j'.$$

From PD kernels to function spaces

For a set X and PD kernel k:

▶ define the linear the space of functions²

$$f(\textbf{x}) = \sum_{i=1}^{N} k(\textbf{x}, \textbf{x}_i) a_i$$

for any $a_1, \ldots, a_N \in \mathbb{R}$, $x_1, \ldots, x_N \in X$ and any $N \in \mathbb{N}$.

▶ define the inner product

$$\langle f,f'\rangle = \sum_{i=1}^N \sum_{j=1}^{N'} k(x_i,x_j') a_i a_j'.$$

 $\mathcal{H}_{\mathbf{k}}$ is the completion to a Hilbert space.

A key result

Theorem

Given a PD kernel k there exists Φ s.t. $k(x,x') = \langle \Phi(x), \Phi(x') \rangle_{\mathcal{H}_k}$ and

$$\mathcal{H}_\Phi \simeq \mathcal{H}_k$$

A key result

Theorem

Given a PD kernel k there exists Φ s.t. $k(x,x')=\langle \Phi(x),\Phi(x')\rangle_{\mathcal{H}_{k}}$ and

$$\mathcal{H}_{\Phi} \simeq \mathcal{H}_{k}$$

Proof: Not so easy...

A key result

Theorem

Given a PD kernel k there exists Φ s.t. $\mathbf{k}(\mathbf{x}, \mathbf{x}') = \langle \Phi(\mathbf{x}), \Phi(\mathbf{x}') \rangle_{\mathcal{H}_{\mathbf{k}}}$ and

$$\mathcal{H}_\Phi \simeq \mathcal{H}_k$$

Proof: Not so easy...

Roughly speaking

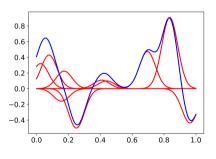

$$f(\mathbf{x}) = \mathbf{w}^{\top} \Phi(\mathbf{x})$$
 \simeq $f(\mathbf{x}) = \sum_{i=1}^{N} k(\mathbf{x}, \mathbf{x}_i) a_i$

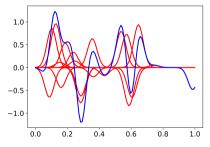

An illustration

Functions defind by Gaussian kernels with large and small widths.

$$f(x) = \sum_{i=1}^N k(x,x_i) a_i = \sum_{i=1}^N e^{-\frac{\|x-x_i\|^2}{2\sigma^2}} a_i$$

RKHS and representer

Functions in \mathcal{H}_k are (limit of) combinations

$$f(\textbf{x}) = \sum_{i=1}^{N} k(\textbf{x},\textbf{x}_i') c_i$$

for a sequence x'_1, \ldots, x'_N .

The representer theorem ensures we can consider kernel combinations on data

$$f(\mathbf{x}) = \sum_{i=1}^{n} k(\mathbf{x}, \mathbf{x}_i) c_i$$

From features and kernels to RKHS and beyond

 $\ensuremath{\mathcal{H}}_k$ has many properties, characterizations, connections:

From features and kernels to RKHS and beyond

 \mathcal{H}_k has many properties, characterizations, connections:

- ► Reproducing property
- Reproducing kernel Hilbert spaces (RKHS)
- ► Mercer theorem (Karhunen Loéve expansion)
- Gaussian processes
- Stochastic calculus Cameron-Martin spaces
- ► Physics: POVM
- ► Harmonic analysis: group representation and wavelet transforms

Reproducing property

By definition of \mathcal{H}_k

- $ightharpoonup k_x = k(x, \cdot) \in \mathcal{H}_k$
- ► Reproducing property

$$f(x) = \langle f, k_x \rangle$$

for all $f \in \mathcal{H}_k$, $x \in X$.

▶ Note that

$$|f(x)-f'(x)|\leqslant \|k_x\|\|f-f'\|, \qquad \forall x\in X.$$

The above observations have a converse.

RKHS

Definition

A RKHS \mathcal{H} is a Hilbert space of functions where $\exists \ k: X \times X \to \mathbb{R}$ s.t.

- $ightharpoonup k_x = k(x,\cdot) \in \mathcal{H}_k$,
- ▶ and

$$f(\mathbf{x}) = \langle f, \mathbf{k}_{\mathbf{x}} \rangle$$
.

Theorem

If \mathcal{H} is a RKHS then k is pos. def.

Proof hint: Let $\Phi(x) = k_x$...

Equivalent RKHS definition by evaluation functionals

If \mathcal{H} is a RKHS then the evaluation functionals

$$e_{\mathbf{x}}(\mathbf{f}) = f(\mathbf{x})$$

are continuous. i.e.

$$|e_{\mathbf{x}}(f) - e_{\mathbf{x}}(f')| \leq ||f - f'||, \quad \forall \mathbf{x} \in X$$

since

$$e_{\mathbf{x}}(\mathbf{f}) = \langle \mathbf{f}, \mathbf{k}_{\mathbf{x}} \rangle$$
.

Note that $L^2(\mathbb{R}^d)$ or $C(\mathbb{R}^d)$ don't have this property³!

Alternative RKHS definition

Turns out the previous property also characterizes a RKHS.

Theorem

A Hilbert space of functions with continuous evaluation functionals is a RKHS.

Proof hint: direct application of Riesz lemma.

Feature maps & kernel/RKHS

- ▶ RKHS and PD kernels are in one to one relation.
- ► Feature map and kernel/RKHS are not.

Examples

- $lackbox{}\Phi(\mathbf{x}) = \mathbf{k}_{\mathbf{x}}$ is a feature map (Aronzajin).
- $\qquad \qquad \textbf{If } (v_i)_i \text{ is a o.n.b. then } \Phi(\textbf{x}) = (\textbf{v}_1(\textbf{x}), \textbf{v}_2(\textbf{x}), \dots) \text{ is a feature map.}$
- ▶ ..

Mercer theorem

A famous feature map.

Let k bounded kernel and ρ probability distribution, and

$$L_k f(x) = \int k(x,x') f(x') d\rho(x').$$

Theorem (Mercer theorem)

If $(\lambda_i, \psi_i)_i$ is the eigensystem ⁴ of L_k, then

$$k(\textbf{x},\textbf{x}') = \sum_{i=1}^{\infty} \lambda_j \psi_j(\textbf{x}) \psi_j(\textbf{x}')$$

where the series converges absolutely and pointwise.

$$\qquad \Phi(\textbf{x}) = (\sqrt{\lambda_1}\psi_1(\textbf{x}), \sqrt{\lambda_2}\psi_2(\textbf{x}), \dots) \text{ is a feature map. }$$

End of the tour

► Feature maps

▶ PD kernels

► RKHS

My view

"It's hard to find a useful function space which is not a RKHS".

L. Rosasco

The one exception are neural nets. But even there RKHS are useful for understanding (something...).
